

Split-Sample Aggregated First Stage: Big vs. Small Cities

Script 52 — Abril 17, 2026

Summary: What the Split Reveals

- **Coalition alignment is a valid instrument only in large cities.** With $\text{muni} \times \text{year}$ FE ($\text{MxJ} + \text{MxT}$), the governor instrument reaches $F = 23.5$ in top-quartile municipalities vs. $F = 0.4$ in the bottom three quartiles. The *full-sample* F was only 2.2 — large-city signal was being diluted by the majority of small municipalities contributing noise.
- **Party alignment ($\text{MxJ} + \text{JxT}$): joint combo significant in large cities only.** The $\text{M} + \text{G} + \text{P}$ bundle reaches $F = 14.6$ in top-quartile cities vs. $F = 1.3$ elsewhere. Yet the full-sample mayor instrument alone shows $F = 12.4$ under this FE structure, with neither subsample reproducing it individually — suggesting the pooled estimate conflates distinct mechanisms across city sizes.
- **BNDES Share: no first-stage signal in either subsample.** No specification exceeds $F = 7$ for the BNDES-share outcome in top-quartile or bottom-three-quartile municipalities, consistent with the full-sample picture. The alignment instruments do not predict the *within-sector* intensive margin of BNDES credit.

F-Statistics: BNDES Extensive — Coalition

Top-quartile vs. bottom-three-quartile municipalities · Unweighted · Pooled-count · Cycle-specific

FE	Sample	Instrument combo					
		M	G	P	M+G	M+P	M+G+P
MxJ+JxT	Top Q4	1.2	2.6	1.6	0.8	1.0	0.7
	Bottom 3Q	0.0	0.3	0.3	0.2	0.9	0.8
MxJ+MxT	Top Q4	1.2	23.5	1.0	16.1	0.4	13.4
	Bottom 3Q	0.1	0.4	1.5	0.2	0.7	0.5

Shaded = $F > 10$. Full-sample MxJ+MxT (from `agg_first_stage`): M=4.5, G=2.2, M+G=3.0, M+G+P=3.3. Signal is entirely concentrated in large cities.

F-Statistics: BNDES Extensive — Party

Top-quartile vs. bottom-three-quartile municipalities · Unweighted · Pooled-count · Cycle-specific

FE	Sample	Instrument combo					
		M	G	P	M+G	M+P	M+G+P
MxJ+JxT	Top Q4	1.4	2.4	3.3	1.6	6.0	14.6
	Bottom 3Q	2.9	1.4	0.0	0.8	0.7	1.3
MxJ+MxT	Top Q4	0.3	0.0	2.3	0.2	1.2	1.1
	Bottom 3Q	0.0	0.5	2.5	0.1	1.2	0.9

Shaded = $F > 10$. Full-sample MxJ+JxT (from `agg_first_stage`): M=12.4, M+G=11.6, M+P=12.9 — neither subsample reproduces these individually; pooled estimate mixes city-size mechanisms.

F-Statistics: BNDES Share — Coalition & Party

Top-quartile vs. bottom-three-quartile municipalities · Unweighted · Pooled-count · Cycle-specific

Alignment	FE	Sample	Instrument combo					
			M	G	P	M+G	M+P	M+G+P
Coalition	MxJ+JxT	Top Q4	1.0	0.4	0.8	1.8	1.0	1.9
		Bottom 3Q	0.2	0.0	0.0	1.2	1.9	1.7
	MxJ+MxT	Top Q4	0.0	1.2	2.8	1.8	1.7	1.4
		Bottom 3Q	0.0	0.5	3.2	0.5	1.3	1.0
Party	MxJ+JxT	Top Q4	6.8	3.4	0.0	6.4	2.8	4.4
		Bottom 3Q	0.0	0.1	0.4	0.1	0.9	0.7
	MxJ+MxT	Top Q4	0.0	0.5	2.0	1.5	1.2	2.4
		Bottom 3Q	0.0	0.1	3.2	0.0	1.6	1.5

No spec reaches $F = 10$. Consistent with full-sample results in `agg_first_stage`. Alignment instruments do not predict the within-sector intensive margin of BNDES credit in either subsample.

Muni $\times$ sector + sector $\times$ year FE. Party alignment. Cycle-specific baseline. Pooled-count exposure. Owner-count aggregation. Unweighted regressions. Sample: bottom three quartiles by mean RAIS employment (2002–2017). Exposure controls interacted with year. SEs clustered by muni + BNDES sector in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

BNDES Share, Party — Top-Quartile Municipalities

Muni×sector + Muni×year FE

	Dep. var: BNDES share _{jmt}					
	M	G	P	M+G	M+P	M+G+P
$\overline{FA}_{\text{party}}^{\text{mayor}}$	-0.002 (0.028)			-0.002 (0.039)	0.006 (0.040)	0.002 (0.040)
